Juneau Drinking Water Quality Exceeds Federal and State Standards During 2004

We are pleased to provide a Water Quality Report containing information that is important to our customers and is required by the Federal Safe Drinking Water Act. This report contains information about the City and Borough of Juneau Water System and covers the period of time from January – December 2004. This report details where your water comes from, what it contains, contact information and a map of our service lines. We welcome your questions.

JUKEAN WATER SOURCES
There are two water sources for Juneau's area-wide water system. Both sources have the capacity to supply the entire system. The Last Chance Basin (LCB) well field on Gold Creek is the primary source. This groundwater source typically supplies about two-thirds of Juneau’s total demand of 3.75 MGD.

The secondary source for the water system operates in conjunction with Alaska Electric Light and Power Company's power generation plant at Salmon Creek (SC). This is an intermittent source due to seasonally high turbidity (cloudiness) and annual AEL&P power plant maintenance. Current ADEC and EPA Surface Water Treatment Rule regulations do not require filtration for this surface water source when the turbidity is within acceptable limits. Salmon Creek typically supplies about one-third of Juneau’s water demand.

When both sources are operating, customers north of Hospital Drive are generally served by water from Salmon Creek. The area south of Hospital Drive and all of Douglas Island is generally served by Last Chance Basin water.

WATER TREATMENT
Neither water source requires filtration. LCB water comes from ground water wells. SC water is monitored regularly to maintain a waiver from the requirement to provide filtration. Both water sources are chlorinated to kill disease causing organisms and fluoridated to promote dental health. Soda ash is added to SC water to raise the pH and alkalinity. This reduces copper and lead leaching into the water from in-house pipes. LCB water does not require treatment to minimize leaching of copper or lead based on studies the Utility has performed.

VULNERABILITY
Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice from their health care providers about drinking treated water. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from The Safe Drinking Water Hotline (800-426-4791), or at www.epa.gov/safewater/mcl.html.
### TEST RESULTS

The results contained in the Treated Drinking Water Quality table are from 2004. The minimum and maximum are provided with the average shown as well except for Arsenic, Chloroform and Bromodichloromethane which only reports the maximum value.

The State of Alaska and EPA limit the amount of certain contaminants in drinking water provided by public water systems in order to ensure that tap water is safe to drink.

Monitoring results show excellent quality. The CBJ Water Utility had one violation in 2004. for allegedly submitting this report late to the ADEC. CBJ drinking water met or exceeded all other state and federal water quality standards for public health protection. Our main goal is to provide you with reliable and safe drinking water.

### SUBSTANCES

**Turbidity** is the amount of suspended material in the water. It typically is inorganic and is not harmful, but may interfere with disinfection. The Salmon Creek water system automatically shuts off when the turbidity exceeds 4 NTU.

**Inorganic Chemicals** include heavy metals, fluoride and nitrate. Less than 1 mg/l of nitrate occurs naturally in southeast Alaska water and is not a concern at this low level.

**Volatile Organic Chemicals (VOC)** are either disinfection by-products such as total trihalomethane (TTHM) formed when naturally occurring organics in water are chlorinated, or from contamination by petroleum and other products.

**Total Organic Carbon (TOC)** is naturally occurring carbon present due to the degradation of organic matter. TOC was measured each month and because the source water TOC level was low, there is no requirement for TOC removal. TOC in samples for both SC and LCB was not detectable.

**Radioactive Contaminants** have not been detected.

### FLUORIDE

Fluoride is currently being added to the water in the form of sodium fluoride in order to promote dental hygiene. The fluoride level for drinking water is kept between 0.7 and 1.2 mg/l. A CBJ task force is currently investigating the benefits and detriments of Fluoride addition to our drinking water and a recommendation is expected this year.

| **ORGANIC AND DISINFECTION BYPRODUCTS (Measured in the Distribution System)** |
| Total Trihalomethane (TTHM) | 80                              | ug/l                                 | 2.2 to 3.9 3.1 avg | 7.5 to 8.4 8 avg | Disinfection by-product |
| Bromodichloromethane       | Not regulated                   | ug/l                                 | 0.7               | 0.68             | By-product of drinking water chlorination |
| Chloroform                 | Not regulated                   | ug/l                                 | 3.3               | 9.56             | Disinfection by-product |
| Haloacetic Acids (HAA5)    | 60                              | ug/l                                 | ND                | 4.92 to 9.83 7.4 avg | Disinfection by-product |

| **CLARITY & ARSENIC (Measured Before Treatment)** |
| Turbidity                  | 5                               | NTU                                  | N/A               | 0.31 to 5.0 0.48 avg | Suspended materials |
| Arsenic                    | 10                              | ug/l                                 | N/A               | 0.27              | Naturally occurring in water |
**CAPITAL IMPROVEMENT PROJECTS**

The CBJ is continually investing in improvements and major repairs to the Water Utility. Improvements in 2004 include the replacing of water mains in Douglas, downtown and the Valley, improvements to the SCADA system and emergency notification, and increased automation along with other infrastructure improvements.

**DEFINED TERMS**

- **CBJ City and Borough of Juneau**
- **CDC Center for Disease Control and Prevention**
- **DEC Alaska State Department of Environmental Conservation**
- **EPA U.S. Environmental Protection Agency**
- **LCB Last Chance Basin of Gold Creek — location of CBJ’s well field**
- **MCL Maximum Contaminant Level — The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLG as feasible using the best available treatment technology.**
- **MCLG Maximum Contaminant Level Goal — The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.**
- **MGD Million Gallons per Day**
- **mg/l Milligram per liter or part per million**
- **ND None Detected at specified level**
- **NTU Nephelometric Turbidity Unit**
- **SCADA Supervisory Control and Data Acquisition**
- **ug/l Microgram per liter or part per billion**

**DEFINITIONS**

**BACKFLOW PREVENTION**

How can your water get contaminated? If you are preparing weedkiller, fertilizer or a chemical solutions when a drop in water pressure occurs the chemical could be siphoned into the water distribution system. In order to prevent this from occurring, backflow prevention devices should be installed. Most locations are required by regulation to install these devices including garden hose connections, janitor sinks, boilers with glycol or other chemicals in them and food and beverage processing facilities. Approved backflow prevention devices must be installed by licensed plumber or the homeowner. If the homeowner installs the device, the CBJ requires that the device be tested by a licensed installer/tester before use and once a year thereafter.

**CONTAMINANTS**

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. Contaminants can be in the form of biological or chemical constituents. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency’s Safe Drinking Water Hotline (800-426-4791).

**CONTAMINANTS THAT WERE NOT DETECTED**

Besides the detected chemicals listed in the Treated Drinking Water Quality Report on the previous page, the CBJ Water Utility has tested for additional chemicals. These were found to not be present in the drinking water. Because of space considerations we have not listed these non-detected chemicals. If you have an interest in reviewing this list, please contact the Water Utility.

**WHAT IF THE WATER LOOKS STRANGE?**

If your water is discolored when it comes from your tap, it may be because we’re doing some maintenance or hydrant flushing work in your area, or the fire department may have just used a nearby hydrant. If you notice discoloration of your water, let the water stand for one to two hours, then flush your cold water tap three to five minutes to see if the water is clear. Discolored water may or may not pose a health risk. Often color is related to rust or sediment build-up in the pipes.
